I. QUESTION

The laplace transform of $x_1(t) = e^{-t}u(t)$ is $X_1(s)$, where u(t) is the unit step function. The laplace transform of $x_2(t) = e^t u(-t)$ is $X_2(s)$. Which one of the following statements is TRUE?

- 1) The region of convergence of $X_1(s)$ is $Re(s) \ge 0$
- 2) The region of convergence of $X_2(s)$ is confined to the left half-plane of s.
- 3) The region of convergence of $X_1(s)$ is confined to the right half-plane of s.
- 4) the imaginary axis in the s-plane is included in both the region of convergence of $X_1(s)$ and the region of convergence of $X_2(s)$.

Solutions:

Symbols	Description
$X_1(s)$	Laplace transform of $x_1(t)$
$X_2(s)$	Laplace transform of $x_2(t)$
u(t)	Unit step function
TADLET	

PARAMETERS, DESCRIPTIONS

Laplace transform of $x_1(t)$ is given by :

$$X_1(s) = \int_{-\infty}^{\infty} e^{-t} e^{-st} u(t) dt$$
 (1)

Let $s = \sigma + j\omega$:

$$X_1(s) = \int_0^\infty e^{-t(\sigma+1)} e^{-tj\beta} dt \tag{2}$$

$$= \left[\frac{-e^{-t(\sigma+1)}e^{-tj\beta}}{(\sigma+1)+j\beta} \right]_0^{\infty} \tag{3}$$

(4)

For $X_1(s)$ to be convergent, $-e^{-t(\sigma+1)}$ and $e^{-tj\beta}$ must converge $\forall t \in (0, \infty)$, so:

$$\sigma + 1 > 0 \implies Re(s) > -1$$
 (5)

$$\left| e^{-tj\beta} \right| < |1|, \forall \beta \epsilon \mathbb{R} \implies Im(s) \epsilon \mathbb{R}$$
 (6)

Putting the limits:

$$X_1(s) = \frac{1}{s+1},\tag{7}$$

ROC of
$$X_1(s) : Re(s) > -1$$
 (8)

Laplace transform of $x_2(t)$ is given by :

$$X_2(s) = \int_{-\infty}^{\infty} e^t e^{-st} u(-t) dt$$

$$= \int_{-\infty}^{0} e^{t(1-\sigma)} e^{-tj\beta} dt$$
(9)

$$= \int_{-\infty}^{0} e^{t(1-\sigma)} e^{-tj\beta} dt \tag{10}$$

$$= \left[\frac{e^{t(1-\sigma)}e^{-tj\beta}}{(1-\sigma)-j\beta} \right]_{-\infty}^{0}$$
(11)

For $X_2(s)$ to be convergent, $e^{-t(1-\sigma)}$ and $e^{-tj\beta}$ must converge $\forall t \in (-\infty, 0)$, so:

$$1 - \sigma > 0 \implies Re(s) < 1 \tag{12}$$

$$\left|e^{-tj\beta}\right| < |1|, \forall \beta \in \mathbb{R} \implies Im(s) \in \mathbb{R}$$
 (13)

Putting the limits

$$X_2(s) = \frac{1}{1-s},\tag{14}$$

ROC of
$$X_2(s) : Re(s) < 1$$
 (15)

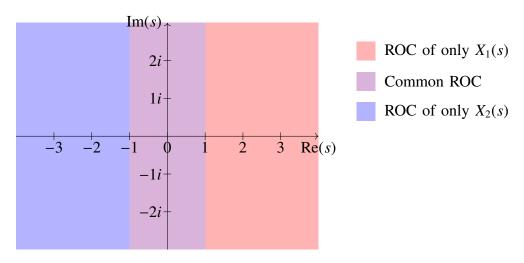

Fig. 1. Representation of ROCs of $X_1(s)$ and $X_2(s)$

Based on the overlap of regions of convergence of $X_1(s)$ and $X_2(s)$ from 1, we can conclude that option 4) is correct.
